

1 Tiny probe

ACDC rain, held-out image

Tiny output

mean entropy $s(x) = 0.461$ nats

2 Candidate risk

$\tau = 0.066$

3 E3 feasibility

$B = 11.97$ ms

4 Decision: Medium

No feasible candidate meets τ ;
lowest-risk feasible is chosen

Error vs. ground truth (orange)

$\hat{r}_t = g_t(s(x))$, one calibrator per candidate grey hatched = exceeds budget
